**Q&A: Twanda Baker**Senior Associate Systems Engineer
SAS Customer Loyalty Team

# Sas Goals

- Increase awareness of and comfort with capabilities in SAS<sup>®</sup> for doing variable selection
  - SAS® Enterprise Guide®
  - SAS<sup>®</sup> Enterprise Miner™
- Share resources for learning more

CUSTOMER LOYALTY TEAM • Support You Can Count On

#### **AGENDA**

# Variable Selection using SAS® Enterprise Guide® and SAS® Enterprise Miner™

- What is variable selection?
- Why is it important?
  - Why should it be on your list of activities when doing predictive modeling?
- How to do variable selection using
  - SAS Enterprise Guide
  - SAS Enterprise Miner

What?

#### Variable Selection or Variable Reduction

Variable selection is used to find a subset of the available inputs that accurately predict the output.

#### Variable Selection

Our life is frittered away by detail...Simplify, simplify.

Henry David Thoreau

## Why Variable Selection?

#### Smaller Data

- Speed/Performance
  - Decreased Computation Time
  - Decreased Scoring Effort
- Cost
  - Data Collection
  - Data Cleaning

#### Other Statistical Reasons

- Interpretability
- Multicollinearity & Irrational Coefficients
- Missing Data
- Redundancy
- Predictive Power
  - Destabilize the parameter estimates
  - Increase the risk of over fitting
  - Noise

The principle of Occam's Razor states that among several plausible explanations for a phenomenon, the simplest is best.

### **Before Variable Selection**

#### Things to consider

## Decide how you intend to use your model.

- Describe the relationship between variables
- Which predictors are statistically significant
- Model has reasonable goodness-of-fit
- Ability to predict

Ideally, the ultimate model would do all of these tasks, describe and predict, equally well. Rarely do we have that luxury in the real world of messy and uncooperative data to accomplish both.

#### Before Variable Selection

### Tasks to complete

- □ Identify outliers and influential points maybe exclude them at least temporarily.
- ■Add in any transformations of the variables that seem appropriate.
- □ Impute missing values

## Variable Selection

### Concepts

#### Variable Selection

- Regression based
- Criterion Based
- Variable Screening
- Variable Clustering

#### Variable Combination

 Principal Components uncorrelated linear combinations of *all* input variables

# Variable Selection Concepts

Input variables and TARGET:	Variable Selection based on correlation with TARGET:	Cluster Scores based on Variable Clustering:	Best Variables based on Variable Clustering:	Principal Componen	ts:

TARGET	TARGET				

#### Variable Selection

#### Methods

- All Possible
  - Best subset selection methods
- Automatic Subset Selection Methods
  - Stepwise, Backward, Forward
- Criterion Based/Variable Screening
  - Variable Ranking, Correlations, Weight of Evidence

#### Which one is best?

## Subset Selection Methods Automatic and All Possible

- Stepwise selection considers adding and deleting predictors at each step of the process
- Forward selection begins with a simple regression model and adds, one at a time. However, once a predictor is in the equation, it is never deleted.
- Backward selection begins with the multiple regression model including all possible predictors and deletes, one at a time. Once a variable is deleted, it is never reconsidered for inclusion.
- Best subsets estimates one regression model for all possible combinations of the predictor variables and chooses the best model among them.

When five predictors (x's) are available for estimation, there are: 5 simple regression models, 10 different two-predictor models, 10 different three-predictor models, 5 different four-predictor models, and 1 five-predictor model, totaling 31 regressions. When ten predictors are available, there are 1,023 possible subsets.

#### Methods available

- Regression
- Variable Screening
  - Correlation
- Variable Clustering
- Principal Components
- Weight of Evidence (WOE) and Information Value (IV)

### First Things First

#### Impute missing values

Categorical

```
if donor_gender in ('U','A') then
    donor_gender='U';

if SES='?' then
    SES='5';

if URBANICITY='?' then
    URBANICITY='M';
```

Set Gender to Unknown, SES to Level 5 (Unknown), Urbanity to M (missing)

Continuous

```
input wealth_rating income_group donor_age months_since_last_prom_resp;
impute wealth_rating / method=random;
impute income_group / method=random;
impute donor_age /method=random;
impute donor_age /method=random;
impute months_since_last_prom_resp / method=random;
run;
```

MEAN, RANDOM, PMEDIAN or Constant Value

### First Things First – Brand new in SAS/Stat 14.1

#### Impute missing values – PROC SURVEYIMPUTE

The SURVEYIMPUTE procedure imputes missing values of an item in a sample survey by replacing them with observed values from the same item. Imputation methods include single and multiple hot-deck imputation and fully efficient fractional imputation (FEFI)

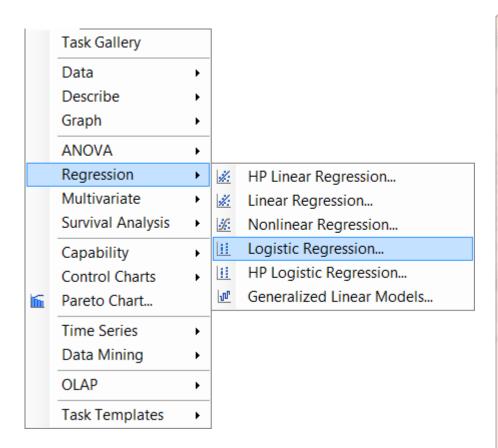

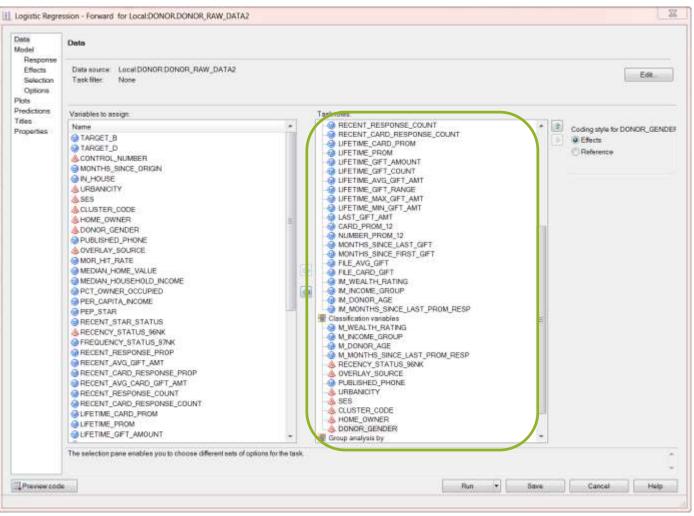

```
/* Joint imputation for Department and Response*/
proc surveyimpute data=SIS_Survey_Sub method=fefi varmethod=jackknife;
class Department Response;
var Department Response;
strata State NewUser;
cluster School;
weight SamplingWeight;
output out=SIS_Survey_Imputed outjkcoefs=SIS_JKCoefs;
run;
```

Select one variable from each cluster. If the cluster has several variables you can select multiple.

## Variable Clustering

```
PROC VARCLUS DATA=sas-data-set outtree=tree;

VAR variables;

RUN;

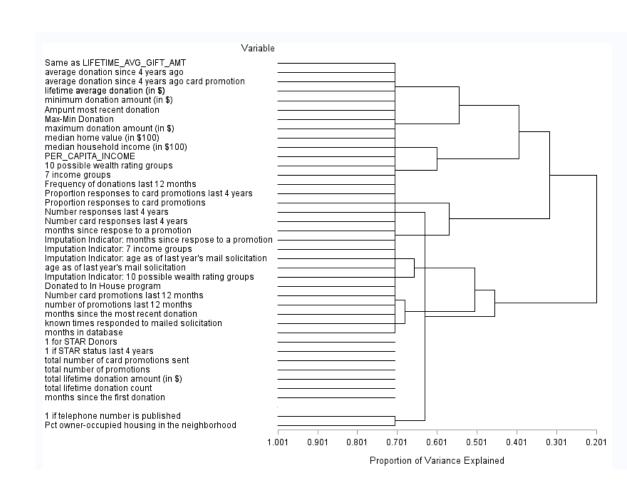

PROC TREE horizontal haxis=axis1 vaxis=axis2;

height _propor_;

id _label_;

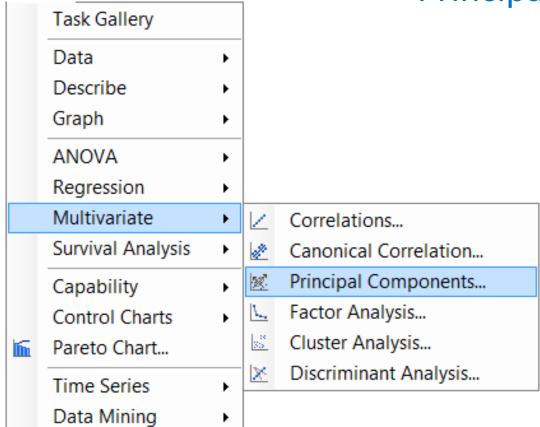

run;
```

Using PROC TREE you can output a tree diagram of the Variable Clusters

## **Principal Components**

OLAP

Task Templates

- Uses all numeric variables
- Hard to interpret individual variables
- Called variable reduction or dimension reduction

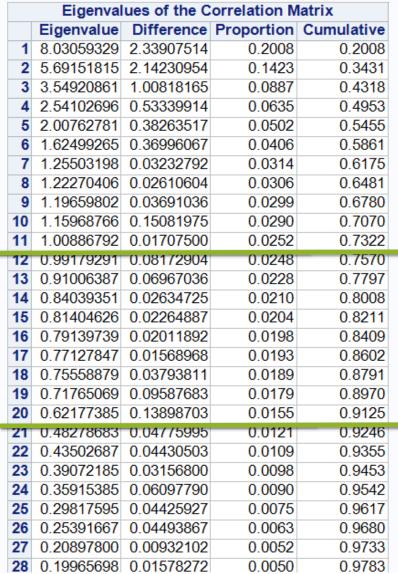

Principal Component Analysis Chapter

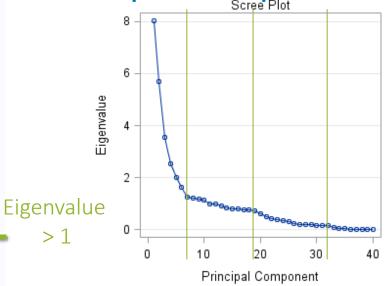

Only for numeric variables

Principal Components

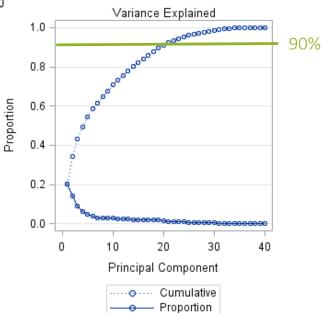

Scree Plot

Proportion of Variance Explained > 90%

- Eigenvalue one criterion (keep any with eigenvalue >1)
- 2. The Scree Test (break between components)
- 3. Total Variance Explained (For example > 90%)

Weight of Evidence (WOE) and Information Value (IV)

Weight of Evidence (WoE) is a measure of how much an attribute in the data is related to the outcome.

$$WoE = \left[\ln\left(\frac{Relative\ Freq\ of\ Not\ Donating_I}{Relative\ Freq\ of\ Donating_i}\right)\right] * 100$$

Information Value (IV) is used to compare predictive power among variables.

 $IV = \sum (Relative\ Freq\ of\ Not\ Donating_i - Relative\ Freq\ of\ Donating_i) * WOE$ 

Only for numeric variables

Weight of Evidence (WOE) and Information Value (IV)

```
proc hpbin data=sas-data-set numbin=5;
   input age/numbin=4;
   input all other variables;
   ods output Mapping=Mapping;
run;
proc hpbin data=sas-data-set WOE BINS META=Mapping;
   target Y/level=nominal order=desc;
run;
```

# StatExplore

## StatExplore

The StatExplore node is a multipurpose node that you use to examine variable distributions and statistics in your data sets. Use the StatExplore node to compute standard univariate statistics, to compute standard bivariate statistics by class target and class segment, and to compute correlation statistics for interval variables by interval input and target. You can also use the StatExplore node to reject variables based on target correlation.

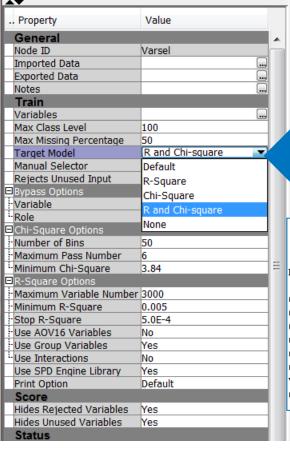

### Variable Selection

# / Metadata

#### Metadata

None — The role of input and rejected variables is based on the active metadata.

**Any** — A variable is set to Rejected if it is rejected in at least one of the incoming metadata sources.

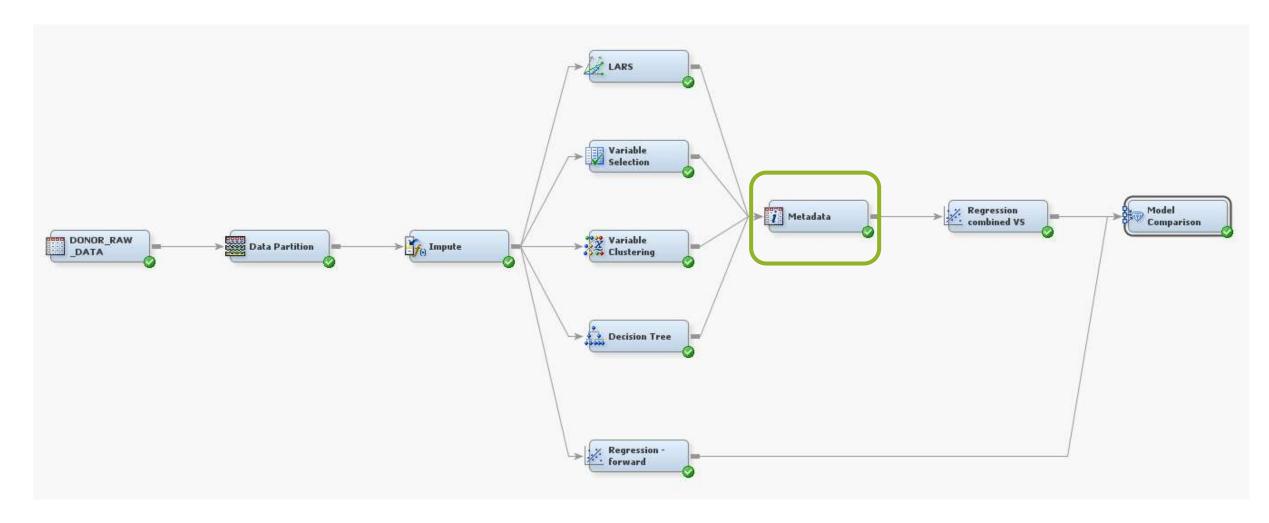

All — A variable is rejected only if it is rejected in all of the incoming metadata sources.

Majority — A variable is rejected if it is rejected in the majority of the incoming metadata sources. If there is a tie, the rejection is based on the active metadata source.
